# The Lady Tasting Wine

Joachim Vandekerckhove

#### The Lady Tasting Wine

The second lady is a Master of Wine

 Claims to be able to discriminate between French Bordeaux wine and a Californian Cabernet Sauvignon, Merlot blend

## The Lady Tasting Wine

The second lady is a Master of Wine

- Claims to be able to discriminate between French Bordeaux wine and a Californian Cabernet Sauvignon, Merlot blend
- She is put to a similar test

• The same data

- The same data
  - ${\color{blue} \bullet}$  RRRRW, so the likelihood is again  $P_R^5(1-P_R)\times C$

- The same data
  - RRRRW, so the likelihood is again  $P_R^5(1-P_R) \times C$
- But different prior notions

- The same data
  - RRRRW, so the likelihood is again  $P_R^5(1-P_R) \times C$
- But different prior notions
  - $\bullet$  One might believe that Masters of Wine can distinguish the Californian imitation from the French original, so that  $P_R \geq 0.5$

- The same data
  - $\bullet$  RRRRW, so the likelihood is again  $P_R^5(1-P_R)\times C$
- But different prior notions
  - One might believe that Masters of Wine can distinguish the Californian imitation from the French original, so that  $P_R \geq 0.5$
  - ... while at the same time doubting that ladies can distinguish the two methods of teamaking, so that  $P_R=0.5$  is most likely (but  $P_R>0.5$  is possible)

- The same data
  - $\bullet$  RRRRW, so the likelihood is again  $P_R^5(1-P_R)\times C$
- But different prior notions
  - One might believe that Masters of Wine can distinguish the Californian imitation from the French original, so that  $P_R \geq 0.5$
  - ... while at the same time doubting that ladies can distinguish the two methods of teamaking, so that  $P_R=0.5$  is most likely (but  $P_R>0.5$  is possible)
- It is possible for you to disagree and still be sensible

• Tea is different from wine

- Tea is different from wine
  - This is relevant and useful prior information

- Tea is different from wine
  - This is relevant and useful prior information
  - We can assume one prior for the case of wine

- Tea is different from wine
  - This is relevant and useful prior information
  - We can assume one prior for the case of wine

• 
$$p(P_R) = K_w(1.01 - P_R)(P_R - 0.49)$$
, for  $0.5 \le P_R \le 1$ 

- Tea is different from wine
  - This is relevant and useful prior information
  - We can assume one prior for the case of wine

• 
$$p(P_R) = K_w(1.01 - P_R)(P_R - 0.49)$$
, for  $0.5 \le P_R \le 1$ 

• ... and another for the case of tea:

- Tea is different from wine
  - This is relevant and useful prior information
  - We can assume one prior for the case of wine

• 
$$p(P_R) = K_w(1.01 - P_R)(P_R - 0.49)$$
, for  $0.5 \le P_R \le 1$ 

- ... and another for the case of tea:
  - $p(P_R) = 0.8$  for  $P_R = 0.5$

- Tea is different from wine
  - This is relevant and useful prior information
  - We can assume one prior for the case of wine

• 
$$p(P_R) = K_w(1.01 - P_R)(P_R - 0.49)$$
, for  $0.5 \le P_R \le 1$ 

- ... and another for the case of tea:
  - $p(P_R) = 0.8$  for  $P_R = 0.5$
  - $p(P_R) = K_t(1 P_R)$  for  $P_R > 0.5$

- Tea is different from wine
  - This is relevant and useful prior information
  - We can assume one prior for the case of wine

• 
$$p(P_R) = K_w(1.01 - P_R)(P_R - 0.49)$$
, for  $0.5 \le P_R \le 1$ 

- ... and another for the case of tea:
  - $p(P_R) = 0.8$  for  $P_R = 0.5$
  - $p(P_R) = K_t(1 P_R)$  for  $P_R > 0.5$
- $K_t$  and  $K_w$  are chosen such that the sum (or integral) over all possibilities is 1. This is always possible if the distribution is proper. The solution for wine here is easy enough (it is the sum of  $(1-P_R)(P_R-0.5)$  for all values of  $P_R$ ), but it isn't in general

 $\, \bullet \,$  Exercise: Compute and plot these in R

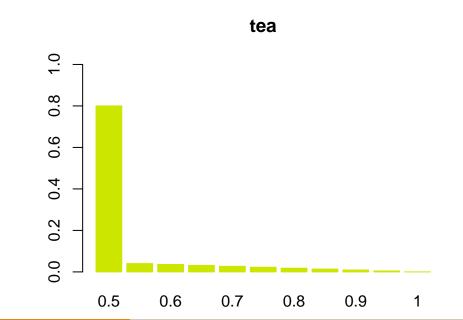

- Exercise: Compute and plot these in R
  - $\ \ \,$  Compute these priors for every value of  $P_R$  and plot them side-by-side

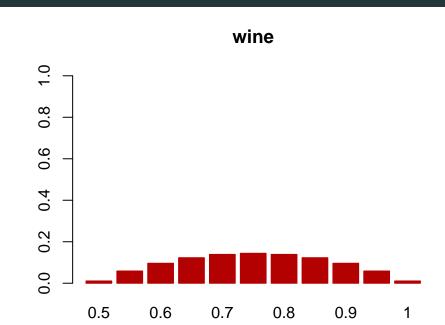

- Exercise: Compute and plot these in R
  - lacktriangle Compute these priors for every value of  $P_R$  and plot them side-by-side
    - Use  $P_R \in \{0.50, 0.55, 0.60, 0.65, 0.70, 0.75, 0.80, 0.85, 0.90, 0.95, 1.0\}$

- Exercise: Compute and plot these in R
  - lacktriangle Compute these priors for every value of  $P_R$  and plot them side-by-side
    - Use  $P_R \in \{0.50, 0.55, 0.60, 0.65, 0.70, 0.75, 0.80, 0.85, 0.90, 0.95, 1.0\}$
  - Wine:  $p(P_R) = K_w(1.01 P_R)(P_R 0.49)$ , for  $0.5 \le P_R \le 1$

- Exercise: Compute and plot these in R
  - $\ \ \,$  Compute these priors for every value of  $P_R$  and plot them side-by-side
    - Use  $P_R \in \{0.50, 0.55, 0.60, 0.65, 0.70, 0.75, 0.80, 0.85, 0.90, 0.95, 1.0\}$
  - Wine:  $p(P_R) = K_w(1.01 P_R)(P_R 0.49)$ , for  $0.5 \le P_R \le 1$
  - $\bullet$  Tea:  $p(P_R)=0.8$  for  $P_R=0.5$  and  $p(P_R)=K_t(1-P_R)$  for  $P_R>0.5$

- Exercise: Compute and plot these in R
  - lacktriangle Compute these priors for every value of  $P_R$  and plot them side-by-side
    - Use  $P_R \in \{0.50, 0.55, 0.60, 0.65, 0.70, 0.75, 0.80, 0.85, 0.90, 0.95, 1.0\}$
  - Wine:  $p(P_R) = K_w(1.01 P_R)(P_R 0.49)$ , for  $0.5 \le P_R \le 1$
  - Tea:  $p(P_R) = 0.8$  for  $P_R = 0.5$  and  $p(P_R) = K_t(1 P_R)$  for  $P_R > 0.5$
- $K_{st}$  is the inverse of the sum of everything else over values of  $P_R$

This was an exercise in normalization:

• From a set of values that give us the relative probabilities of possible values of  $P_R$ , find the absolute probabilities by enforcing that all probabilities must add up to 1 (the possible values of  $P_R$  form a disjoint set)

#### This was an exercise in normalization:

- From a set of values that give us the relative probabilities of possible values of  $P_R$ , find the absolute probabilities by enforcing that all probabilities must add up to 1 (the possible values of  $P_R$  form a disjoint set)
- Often we can just deal with relative probabilities for convenience

#### This was an exercise in normalization:

- From a set of values that give us the relative probabilities of possible values of  $P_R$ , find the absolute probabilities by enforcing that all probabilities must add up to 1 (the possible values of  $P_R$  form a disjoint set)
- Often we can just deal with relative probabilities for convenience
- Bayesians will routinely ignore these scaling values and only express equations using the "proportional to" symbol:

$$P(H_0|X) \propto P(H_0)P(X|H_0)$$

#### This was an exercise in normalization:

- From a set of values that give us the relative probabilities of possible values of  $P_R$ , find the absolute probabilities by enforcing that all probabilities must add up to 1 (the possible values of  $P_R$  form a disjoint set)
- Often we can just deal with relative probabilities for convenience
- Bayesians will routinely ignore these scaling values and only express equations using the "proportional to" symbol:

$$P(H_0|X) \propto P(H_0)P(X|H_0)$$

•  $((A \propto B), (B \propto C)) \rightarrow (A \propto C)$ 

#### This was an exercise in normalization:

- From a set of values that give us the relative probabilities of possible values of  $P_R$ , find the absolute probabilities by enforcing that all probabilities must add up to 1 (the possible values of  $P_R$  form a disjoint set)
- Often we can just deal with relative probabilities for convenience
- Bayesians will routinely ignore these scaling values and only express equations using the "proportional to" symbol:

$$P(H_0|X) \propto P(H_0)P(X|H_0)$$

- $((A \propto B), (B \propto C)) \rightarrow (A \propto C)$
- I usually make the proportionality explicit to avoid confusion

• Wine: 
$$p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 - P_R)(P_R - 0.49) \times C(1 - P_R)^{\#W}P_R^{\#R}$$

- Wine:  $p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 P_R)(P_R 0.49) \times C(1 P_R)^{\#W}P_R^{\#R}$
- Tea:

- Wine:  $p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 P_R)(P_R 0.49) \times C(1 P_R)^{\#W}P_R^{\#R}$
- Tea:
  - $p(P_R|\#R, \#W, tea) = S_t \times 0.8 \times C(1 P_R)^{\#W} P_R^{\#R}$  if  $P_R = 0.5$

• Wine: 
$$p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 - P_R)(P_R - 0.49) \times C(1 - P_R)^{\#W}P_R^{\#R}$$

- Tea:
  - $p(P_R|\#R, \#W, tea) = S_t \times 0.8 \times C(1 P_R)^{\#W} P_R^{\#R}$  if  $P_R = 0.5$
  - $p(P_R|\#R, \#W, tea) = S_t \times K_t(1 P_R) \times C(1 P_R)^{\#W} P_R^{\#R}$ if  $P_R > .05$

Exercise: plot these in R, using #R=5, #W=1

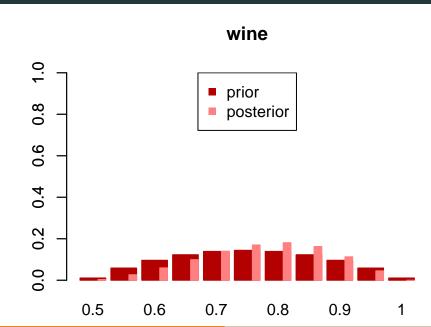

```
• Wine: p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 - P_R)(P_R - 0.49) \times C(1 - P_R)^{\#W} P_R^{\#R}
```

- Wine:  $p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 P_R)(P_R 0.49) \times C(1 P_R)^{\#W} P_R^{\#R}$
- Tea:

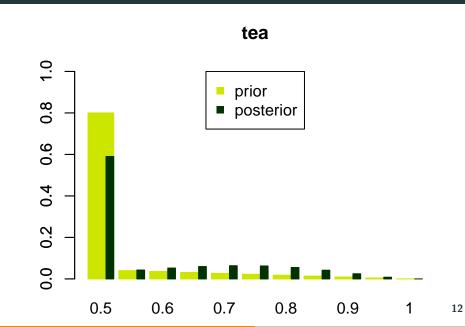

- Wine:  $p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 P_R)(P_R 0.49) \times C(1 P_R)^{\#W} P_R^{\#R}$
- Tea:
  - $p(P_R|\#R, \#W, tea) = S_t \times 0.8 \times C(1 P_R)^{\#W} P_R^{\#R}$  if  $P_R = 0.5$

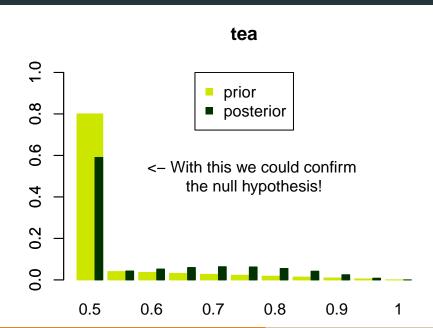

- Wine:  $p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 P_R)(P_R 0.49) \times C(1 P_R)^{\#W} P_R^{\#R}$
- Tea:
  - $p(P_R|\#R, \#W, tea) = S_t \times 0.8 \times C(1 P_R)^{\#W} P_R^{\#R}$  if  $P_R = 0.5$
  - $p(P_R|\#R, \#W, tea) = S_t \times K_t(1 P_R) \times C(1 P_R)^{\#W} P_R^{\#R}$ if  $P_R > .05$

- Wine:  $p(P_R|\#R, \#W, wine) = S_w \times K_w(1.01 P_R)(P_R 0.49) \times C(1 P_R)^{\#W}P_R^{\#R}$
- Tea:
  - $p(P_R|\#R, \#W, tea) = S_t \times 0.8 \times C(1 P_R)^{\#W} P_R^{\#R}$  if  $P_R = 0.5$
  - $p(P_R|\#R, \#W, tea) = S_t \times K_t(1 P_R) \times C(1 P_R)^{\#W} P_R^{\#R}$ if  $P_R > .05$
- Also, make them pretty.
